

Basic Training

What other codes are like

What Python is like

Outline

- ▶ Hello World!
- ▶ Calculator/basic math
- ▶ Strings
- ▶ Variables
- ▶ Basic control statements
 - ▶ Indentation!

C++

```
#include <iostream>
int main()
{
    std::cout << " Hello World!" << std::endl;
}
```

```
BootCamp> g++ -o hello hello.cpp
BootCamp> ./hello
Hello World!
BootCamp>
```

Java

```
class HelloWorld {
    static public void main( String args[] ) {
        System.out.println( " Hello World!" );
    }
}
```

```
BootCamp> javac hello.java
BootCamp> java HelloWorld
Hello World!
BootCamp>
```

Fortran

```
PROGRAM HELLO
WRITE (*,100)
STOP
100 FORMAT ( ' Hello World! ' /)
END
```

```
BootCamp> g77 -o hello hello.f
BootCamp> ./hello
Hello World!
BootCamp>
```

► Examples of compiled languages

Scripted

Python

```
print "Hello World!"
```

```
BootCamp> python hello.py  
Hello World!  
BootCamp>
```

Interactive

```
BootCamp > python  
>>> print "Hello World!"  
Hello World!  
>>>
```

```
In [1]: print "Hello World!"  
Hello World!
```

```
In [2]: █
```

2 quick points

1. Python provides an interactive way to develop code and execute scripts
2. What you do interactively is the same thing as a script

Calculator

```
>>> print 2 + 2
```

Calculator

```
>>> print 2 + 2  
4
```

Calculator

```
>>> print 2 + 2  
4  
>>> 2 + 2
```

Calculator

```
>>> print 2 + 2  
4  
>>> 2 + 2  
4
```

Calculator

```
>>> print 2 + 2  
4  
>>> 2 + 2  
4  
>>> print 2.1 + 2
```

Calculator

```
>>> print 2 + 2  
4  
>>> 2 + 2  
4  
>>> print 2.1 + 2  
4.1
```

Calculator

```
>>> print 2 + 2
4
>>> 2 + 2
4
>>> print 2.1 + 2
4.1
>>> 2.1 + 2 == 4.0999999999999996
```

Calculator

```
>>> print 2 + 2
4
>>> 2 + 2
4
>>> print 2.1 + 2
4.1
>>> 2.1 + 2 == 4.0999999999999996
True
```

Calculator

```
>>> print 2 + 2
4
>>> 2 + 2
4
>>> print 2.1 + 2
4.1
>>> 2.1 + 2 == 4.0999999999999996
True
```

- ▶ There are int & float but not doubles
- ▶ Python stores floats as their byte representation. Therefore it is limited by the same 16-bit issues as most other languages
- ▶ When doing calculations, unless you specify, Python will store the results in the smallest byte representation

Calculator

```
>>> 2 + 2
```

Calculator

```
>>> 2 + 2  
4
```

Calculator

```
>>> 2 + 2  
4  
>>> 2 + 2
```

Calculator

```
>>> 2 + 2
```

```
4
```

```
>>> 2 + 2
```

```
File "<stdin>", line 1
```

```
    2+2
```

```
    ^
```

```
IndentationError: unexpected indent
```

Calculator

```
>>> 2 + 2
```

```
4
```

```
>>> 2 + 2
```

```
File "<stdin>", line 1
```

```
    2+2
```

```
    ^
```

```
IndentationError: unexpected indent
```

```
>>> 2 # this is a comment and is not printed
```

Calculator

```
>>> 2 + 2
```

```
4
```

```
>>> 2 + 2
```

```
File "<stdin>", line 1
```

```
    2+2
```

```
    ^
```

```
IndentationError: unexpected indent
```

```
>>> 2 # this is a comment and is not printed
```

```
2
```

Calculator

```
>>> 2 + 2
4
>>> 2 + 2
File "<stdin>", line 1
    2+2
    ^
IndentationError: unexpected indent
>>> 2 # this is a comment and is not printed
2
>>> # this is also a comment
```

Calculator

```
>>> 2 + 2
4
>>> 2 + 2
File "<stdin>", line 1
    2+2
    ^
IndentationError: unexpected indent
>>> 2 # this is a comment and is not printed
2
>>> # this is also a comment
>>>
```

Calculator

```
>>> 2 + 2
4
>>> 2 + 2
File "<stdin>", line 1
    2+2
    ^
IndentationError: unexpected indent
>>> 2 # this is a comment and is not printed
2
>>> # this is also a comment
>>>
```

1. Indentation matters!
2. When you mess up, python is gentle
3. # starts a comment until the end of the line

Calculator

```
>>> (3.0*10.0 - 25.0)/5.0
```

Calculator

```
>>> (3.0*10.0 - 25.0)/5.0  
1.0
```

Calculator

```
>>> (3.0*10.0 - 25.0)/5.0
```

```
1.0
```

```
>>> print 3.085e18*1e6 # this is a Megaparsec in units of cm!
```

Calculator

```
>>> (3.0*10.0 - 25.0)/5.0
```

```
1.0
```

```
>>> print 3.085e18*1e6 # this is a Megaparsec in units of cm!
```

```
3.085e+24
```

Calculator

```

Strings

- ▶ Strings are sequences of characters
 - ▶ They are can are indexed and can be sliced up like arrays
 - ▶ You can concatenate strings together with the + sign
- ▶ Strings are immutable (unlike C). You cannot change a string in place (this sounds worse than it is...)
- ▶ Strings can be formatted and compared

Strings

```
>>> x = "spam" ; print type(x)
```

Strings

```
>>> x = "spam" ; print type(x)  
<type "str">
```

Strings

```
>>> x = "spam" ; print type(x)
<type "str">
>>> print "hello!$ \n...my sire."
```

Strings

```
>>> x = "spam" ; print type(x)
<type "str">
>>> print "hello!$ \n...my sire."
hello!
...my sire.
```

Strings

```
>>> x = "spam" ; print type(x)
<type "str">
>>> print "hello!$ \n...my sire."
hello!
...my sire.
>>> "hello! \n...my sire."
```

Strings

```
>>> x = "spam" ; print type(x)
<type "str">
>>> print "hello!$ \n...my sire."
hello!
...my sire.
>>> "hello! \n...my sire."
'hello! \n...my sire.'
```

Strings

```
>>> x = "spam" ; print type(x)
<type "str">
>>> print "hello!$ \n...my sire."
hello!
...my sire.
>>> "hello! \n...my sire."
'hello! \n...my sire.'
>>> "wah?!" == 'wah?!'
```

Strings

```
>>> x = "spam" ; print type(x)
<type "str">
>>> print "hello!$ \n...my sire."
hello!
...my sire.
>>> "hello! \n...my sire."
'hello! \n...my sire.'
>>> "wah?!" == 'wah?!'
True
```

Strings

```
>>> x = "spam" ; print type(x)

'wah?!' said the student
>>> print "\"wah?!\" said the student"
"wah?!" said the student
```

- ▶ backslashes (\) start special (escape) characters:
 - ▶ \n = newline
 - ▶ \t = tab
 - ▶ \a = bell
- ▶ string literals are defined with double quotes or quotes. The outermost quote type cannot be used inside the string (unless it's escaped with a backslash)

Strings

```
>>> # raw strings don't escape characters
```

Strings

```
>>> # raw strings don't escape characters
>>> print r'This is a raw string...newlines \r\n are ignored.'
```

Strings

```
>>> # raw strings don't escape characters
>>> print r'This is a raw string...newlines \r\n are ignored.'
This is a raw string...newlines \r\n are ignored.
```

Strings

```
>>> # raw strings don't escape characters
>>> print r'This is a raw string...newlines \r\n are ignored.'
This is a raw string...newlines \r\n are ignored.

>>> len(s)
4
>>> len("eggs\n")
5
>>> len("")
0
>>> s[0]
's'
>>> s[-1]
'm'
```

- ▶ `len()` give us the length of an array
- ▶ Strings are zero indexed
- ▶ Strings can also count backwards

Strings

We can think of strings as arrays, unlike in C you never really need to deal with addressing characters locations in memory

Useful for slicing: indices are between the characters

```
>>> s[0:1] # get every character between 0 and 1
```

```
>>> s[0:1] # get every character between 0 and 1
's'
```

```
>>> s[0:1] # get every character between 0 and 1
's'
>>> s[1:4] # get every character between 1 and 4
```

```
>>> s[0:1] # get every character between 0 and 1
's'
>>> s[1:4] # get every character between 1 and 4
'pam'
```

```
>>> s[0:1] # get every character between 0 and 1
's'
>>> s[1:4] # get every character between 1 and 4
'pam'
>>> s[-2:-1]
```

```
>>> s[0:1] # get every character between 0 and 1
's'
>>> s[1:4] # get every character between 1 and 4
'pam'
>>> s[-2:-1]
'a'
```

```
>>> s[0:1] # get every character between 0 and 1
's'
>>> s[1:4] # get every character between 1 and 4
'pam'
>>> s[-2:-1]
'a'
>>> ## slicing [m:n] will return abs(n-m) characters
```

```
>>> s[0:1] # get every character between 0 and 1
's'
>>> s[1:4] # get every character between 1 and 4
'pam'
>>> s[-2:-1]
'a'
>>> ## slicing [m:n] will return abs(n-m) characters
>>> s[0:100] # if the index is beyond the len(str), you dont segfault!
```

```
>>> s[0:1] # get every character between 0 and 1
's'
>>> s[1:4] # get every character between 1 and 4
'pam'
>>> s[-2:-1]
'a'
>>> ## slicing [m:n] will return abs(n-m) characters
>>> s[0:100] # if the index is beyond the len(str), you dont segfault!
'spam'
```

```
>>> s[0:1] # get every character between 0 and 1
's'
>>> s[1:4] # get every character between 1 and 4
'pam'
>>> s[-2:-1]
'a'
>>> ## slicing [m:n] will return abs(n-m) characters
>>> s[0:100] # if the index is beyond the len(str), you dont segfault!
'spam'
>>> s[1:] # python runs the index to the end
```

```
>>> s[0:1] # get every character between 0 and 1
's'
>>> s[1:4] # get every character between 1 and 4
'pam'
>>> s[-2:-1]
'a'
>>> ## slicing [m:n] will return abs(n-m) characters
>>> s[0:100] # if the index is beyond the len(str), you dont segfault!
'spam'
>>> s[1:] # python runs the index to the end

'pam'
>>> s[:2] # python runs the index to the beginning
'sp'
```

$s = s[:n] + s[n:]$ for all n

Basic Control Flow

Python had pretty much all of what you need:

if...elif...else, for, while

As well as:

break, continue (within loops)

Does not have:

case(explicitly) goto

Does have:

pass

Flow is done within blocks (where indention matters)

```
>>> x =1
```

Flow is done within blocks (where indention matters)

```
>>> x =1  
>>> if x > 0:
```

Flow is done within blocks (where indention matters)

```
>>> x =1  
>>> if x > 0:  
...     print "yo"
```

Flow is done within blocks (where indention matters)

```
>>> x =1  
>>> if x > 0:  
...     print "yo"  
...else:
```

Flow is done within blocks (where indention matters)

```
>>> x =1  
>>> if x > 0:  
...     print "yo"  
...else:  
...     print "dude"
```

Flow is done within blocks (where indention matters)

```
>>> x =1
>>> if x > 0:
...     print "yo"
...else:
...     print "dude"
...
```

Flow is done within blocks (where indention matters)

```

```
>>> x =1
>>> if x > 0:
...     print "yo"
...else:
...         print "dude"
...
```

Flow is done within blocks (where indention matters)

```
>>> x =1
>>> if x > 0:
...     print "yo"
...else:
...     print "dude"
...
yo
```

Note colons and indentations (tabbed or spaced)

```
>>> x =1
>>> if x > 0:
...     print "yo"
...else:
...         print "dude"
...
yo
```

Flow is done within blocks (where indentation matters)

```
>>> x =1
>>> if x > 0:
...     print "yo"
...else:
...     print "dude"
...
yo
```

Note colons and indentations (tabbed or spaced)

```
>>> x =1
>>> if x > 0:
...     print "yo"
...else:
...         print "dude"
...
yo
```

Indentations within the same block must be the same but not within different blocks but this is ugly and might cause confusion

One-liners

```
>>> print "yo" if x > 0 else "dude"
```

One-liners

```
>>> print "yo" if x > 0 else "dude"  
"dude"
```

One-liners

```
>>> print "yo" if x > 0 else "dude"  
"dude"
```

A small program:

One-liners

```
>>> print "yo" if x > 0 else "dude"  
"dude"
```

A small program:

One-liners

```
>>> print "yo" if x > 0 else "dude"  
"dude"
```

A small program:

```
>>> x = 1
```

One-liners

```
>>> print "yo" if x > 0 else "dude"  
"dude"
```

A small program:

```
>>> x = 1  
>>> while True:
```

One-liners

```
>>> print "yo" if x > 0 else "dude"  
"dude"
```

A small program:

```
>>> x = 1  
>>> while True:  
...     print "yo" if x > 0 else "dude"
```

One-liners

```
>>> print "yo" if x > 0 else "dude"  
"dude"
```

A small program:

```
>>> x = 1  
>>> while True:  
...     print "yo" if x > 0 else "dude"  
...     x *= -1
```

One-liners

```
>>> print "yo" if x > 0 else "dude"  
"dude"
```

A small program:

```
>>> x = 1  
>>> while True:  
...     print "yo" if x > 0 else "dude"  
...     x *= -1  
...
```

One-liners

```
>>> print "yo" if x > 0 else "dude"  
"dude"
```

A small program:

```
>>> x = 1  
>>> while True:  
...     print "yo" if x > 0 else "dude"  
...     x *= -1  
...  
yo

Control-c break a loop and drops you back to the terminal

Case statements can be constructed with a bunch of `if, elif,...else`

Case statements can be constructed with a bunch of `if, elif,...else`

```
>>> if x < 1:
```

Case statements can be constructed with a bunch of `if, elif, ...else`

```
>>> if x < 1:  
...     print "t"
```

Case statements can be constructed with a bunch of `if, elif,...else`

```
>>> if x < 1:  
...     print "t"  
...     elif x > 100:
```

Case statements can be constructed with a bunch of `if, elif,...else`

```
>>> if x < 1:  
...     print "t"  
... elif x > 100:  
...     print "yo"
```

Case statements can be constructed with a bunch of `if, elif,...else`

```
>>> if x < 1:  
...     print "t"  
... elif x > 100:  
...     print "yo"  
... else:
```

Case statements can be constructed with a bunch of `if, elif,...else`

```
>>> if x < 1:  
...     print "t"  
... elif x > 100:  
...     print "yo"  
... else:  
....     print "dude"
```

Case statements can be constructed with a bunch of `if, elif,...else`

```
>>> if x < 1:  
...     print "t"  
... elif x > 100:  
...     print "yo"  
... else:  
...     print "dude"  
dude
```

Case statements can be constructed with a bunch of `if, elif,...else`

```
>>> if x < 1:  
...     print "t"  
... elif x > 100:  
...     print "yo"  
... else:  
...     print "dude"  
dude
```

Ordering matters. The first block of `True` in an `if/elif` gets executed then everything else does not.

Blocks cannot be empty

Exercise for the Breakout

Write a program which allows the user to build up a sentence one word at a time, stopping when they enter a period (.), exclamation (!), or question mark (?).

Example interaction:

```
Please enter a word in the sentence (enter . ! or ? to end.): My
...currently: My
Please enter a word in the sentence (enter . ! or ? to end.): name
...currently: My name
Please enter a word in the sentence (enter . ! or ? to end.): is
...currently: My name is
Please enter a word in the sentence (enter . ! or ? to end.): Slim
...currently: My name is Slim
Please enter a word in the sentence (enter . ! or ? to end.): Shady
...currently: My name is Slim Shady
Please enter a word in the sentence (enter . ! or ? to end.): !
--->My name is Slim Shady!
```
